

WHY NOW

AI is going rogue everywhere. We put it to work for you.

While AI agents cause accidental breaches across the globe, Attack Path Security deliberately harnesses them — to find your weaknesses **before criminals do**. Nobody else is doing this on purpose. The timing is perfect.

THE NEW REALITY

Attackers already use AI to scan and break into companies in minutes, not weeks.

Traditional testing is too slow — a once-a-year checkup can't keep up with daily change.

We test the way attackers attack — intelligently, continuously, and at machine speed.

HOW IT WORKS

1

MAP

Our agents chart everything an attacker can see — your websites, servers, and exposed systems — building a complete picture of your attack surface.

2

PROBE

The agents test for weaknesses across your systems and applications — probing the same paths a real attacker would take, without disrupting your business.

3

VERIFY & REPORT

A senior human security expert confirms every finding, then delivers a clear, prioritized report with practical steps to fix each issue.

TESTING YOU CAN TRUST

Written authorization first

We never touch a system without your signed permission.

Strictly defined targets

Only what you approve is tested. Nothing outside it is ever touched.

Human in charge

A senior expert reviews and approves every step the agents take.

Your data stays yours

Findings are confidential; client data is segregated and securely destroyed after the engagement.

Know your **attack path** before
attackers do.
